Use and Care Instructions

# Scotts® ProVista™ Professional Use and Care Instructions

## Cost Effective

- Scotts® ProVista™ grows slower than conventional Kentucky Bluegrass, saving valuable mowing time and reducing maintenance costs

## Complete Weed Control

- Easily combat weeds, without damaging turf
- Beautiful green, uniform, dense appearance

## Sustainable

- Reduced mowing means less carbon emissions
- Reduced Inputs: stays green with less fertilizer and herbicide

## Half the Mowing

- Save valuable time and money
- No change in mowing heights required

## Follow Standard Cool Season Turf Maintenance Program

- Refer to your state extension site for best management practices
- No special care needed vs. conventional Kentucky Bluegrass

## Spring mowing tip for optimal appearance

- When Spring flowers are noticeable, for a single mowing event reduce mowing height enough to remove visible flowers. Following this mowing event, fertilize to return turf to original height of cut.

## An Added Tool in Your Toolbox - for Invasive, Grassy Weeds

### How to use Glyphosate on Scotts ProVista

Only to be used on Scotts ProVista turf; will kill conventional grass

- Only apply if alternative active ingredients were not effective or are not available for existing weed pressure.
- Utilize pre-emergent herbicides for weed prevention to minimize the need for broadcast glyphosate applications.
- Scotts ProVista turfgrass that is healthy and actively growing under normal growing conditions is tolerant to glyphosate. Injury may occur when applied under stresses, such as, but not limited to heat, drought, shade, salinity, disease, insect pressure, or cold (below 50°F within 10 days of an application).

- For spring seeded establishment, a single professionally applied broadcast glyphosate application should occur no sooner than 6 weeks after seeding. For fall seeded establishment, a professionally applied glyphosate application should be applied no sooner than the following spring after turf is actively growing. These broadcast glyphosate applications should be made in conjunction with a pre-emergent herbicide that is safe during seeding and early establishment. Glyphosate applications should not be made if air temperatures are forecasted to drop below 50F within 7 days of an application.
- When spraying glyphosate, tank mix other post-emergent herbicides with efficacy on the target weed to ensure multiple modes of action are applied.
- Apply 41% Glyphosate at 32 fl oz per acre (or 0.75 fl oz per 1,000 ft<sup>2</sup>) in carrier volume of 40 gal per acre (or 1 gal per 1,000 ft<sup>2</sup>) with a maximum of 3 broadcast applications per calendar year.
- For difficult to control weeds, apply 48 fl oz per acre (or 1.125 fl oz per 1,000 ft<sup>2</sup>) in carrier volume of 40 gal per acre (or 1 gal per 1,000 ft<sup>2</sup>) with a maximum of 2 broadcast applications per calendar year.
